Welcome to the **Centenary Edition of** Port of London News, celebrating 100 years of reporting life on the tidal Thames.

biggest port and the Thames its busiest inland waterway; the river continues to provide tens of thousands of great jobs and opportunities; and above all, the Thames remains very much at the centre of our national life and sense of what makes London and the Estuary what they are.

One final thought on this comparison between 1925 and now. In the 1920s, much merchant shipping was steam powered; coal ruled the waves. The uptake of new diesel-based technology was underway, but many thought a complete energy transition would never happen. I hope our successors writing in 2125 will be able

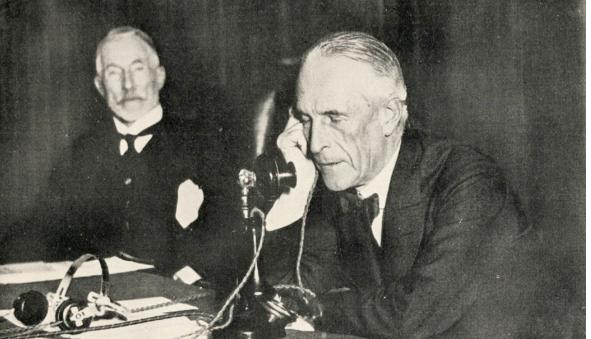

to look back on our era as a similar transition point, by when the idea of burning fossil fuels to power vessels will seem like steam power does to us. I also have every confidence that our successors will be able to continue celebrating the enduring role of the Thames in the economic and cultural life of this country.

FOREWORD

Lord Ritchie makes the first call on the PLA's new automatic telephone system - signalling a future built

Foreword for this centenary edition of the Tidal In 1925, the then PLA Chairman Baron

■ t is a great honour to be asked to pen the

Ritchie of Dundee, wrote that he hoped the new newsletter would serve the purpose of "extending a knowledge of the many-sided activities of the Port of London Authority". He also hoped that it would build "goodwill and sympathy" amongst the business community connected with the Port "so vitally interested in its welfare".

These continue to be the twin goals of the Tidal Thames News. To share information about what is happening on and around the river, including the PLA's activities; and to build a sense of a River Thames community through the shared interests of its readers.

Over those hundred years it is easy to think about the huge changes that have occurred on the Thames - the role played by the Port during the Second World War, the decline and re-invention of the London Docklands, and the growing diversity of people working on the river - to name but three. (I hazard that there were no women watermen or lightermen in 1925, but happy to be corrected if wrong!).

that are unchanging: London remains the UK's

I am pleased to confirm that the range of parties with an interest in the use and success of the Port is at least as wide ranging as it was in 1925, and most probably more so. I'd also like to pay tribute to the women and men of the PLA who today serve such varied stakeholders, just as their predecessors did a century ago. But I'm also struck by some of the things

In November 1925, the Port of London Authority launched its first staff and industry publication, PLA Monthly. Priced at sixpence, it marked the start of a new era in how the Authority communicated with its workforce and the wider maritime community.

Britain was still rebuilding after the First World War, and shipping was modernising fast - electric cranes, automatic telephones, and new liners were transforming dockside life.

A New Voice for the River

Armed troops leading a food convoy into London

On people's minds:

Opening of the PLA's Trinity Square headquarters (1922)

Growing global trade links with the Commonwealth

Rapid advances in communication and mechanisation

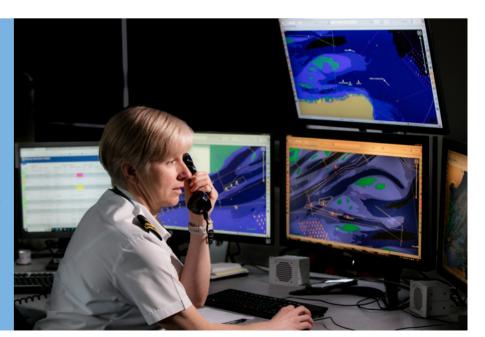

New PLA Chair (1925)

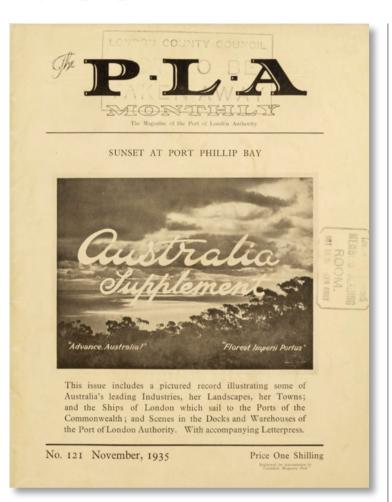

King George V Docks opened in 1921

Modern echo:

In 2025, communication remains at the heart of what we do – from real-time vessel tracking to digital engagement with river users.

6 PORT OF LONDON NEWS: CENTENARY EDITION 2025 7

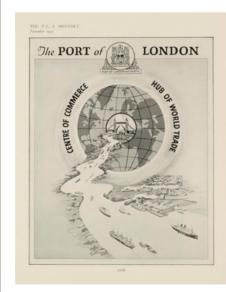

Ten years after its first edition,
PLA Monthly was now a regular,
confident publication reflecting a
port that had weathered economic
challenges and was looking outward
again. The Australia Supplement
of 1935 celebrated trade links
across the Empire, while adverts for
Cory, P&O Cruises, and dredging
specialists captured a period of
optimism and growth.

Leisure and culture also found their place on the river; the PLA was running its own public dock and river cruises, offering Londoners a new way to experience their city from the water. The origin of river cruises could be seen as early as WWI when the PLA took convalescing troops on trips down the river. These early efforts to make the Thames a destination echo today's thriving river tourism.

On people's minds:

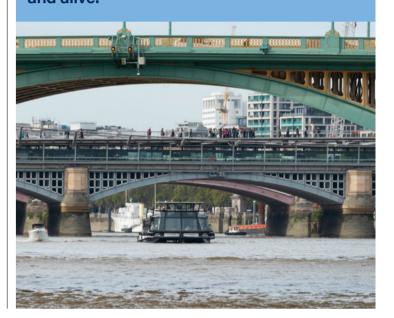

Recovery from the Great Depression

Expanding international trade and exports

Birth of river leisure and cultural activity

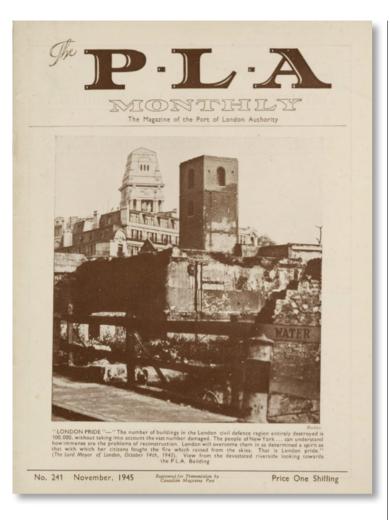

Modern echo:

In 2025, the Thames carries millions of passengers a year - from commuter hybrid and electric ferries to entertaining tourboats - continuing the PLA's long-standing mission to keep the river open, accessible and alive.

Early signs of PLA community work: PLA police organise trip for dockworkers' children to the beach

Modern echo:

Eighty years later, resilience and adaptation remain at the heart of the PLA's mission, from navigation to environmental protection,

On people's minds:

Rebuilding London's docks after the Blitz

Wartime innovation: radar, radio, and communication advances

Return to peacetime trade and employment

uring World War II, the Port of London Authority (PLA) was central to Britain's survival. As the governing body of the Port of London, it managed one of the busiest ports

in the world, ensuring the steady movement of essential imports such as food, fuel, and munitions. Despite the devastation of the Blitz, the PLA kept the port operational, organising the repair of damaged docks, warehouses, and cranes, and coordinating closely with the Royal Navy and the Ministry of War Transport to

One of its major warehouse complexes in Whitechapel, the Commercial Road Goods Depot, housed the East End's single biggest bomb shelter. The building which comprised a London, Midland and Scotland (LMS) goods sidings below a large warehouse became known

maintain Britain's supply lines.

as the Tilbury Shelter and during the Blitz up to 14,000 took shelter at night.

A detachment of the PLA Local Defence Volunteers, later

the Home Guard, in training at the Royal Docks in 1940

When bombing reduced London docks capacity and getting ships to London became a riskier challenge, the PLA extended its activities to other British ports. Glasgow, in particular, became a vital centre for shipping crossing the Atlantic. The PLA helped coordinate the transfer of 300 barges and cargo-handling operations to the Clyde as well as staff, ensuring that wartime imports continued to reach Britain. This cooperation between the London and Glasgow ports demonstrated the PLA's national reach and adaptability in crisis conditions.

In addition to domestic operations, the PLA contributed to the war effort overseas by deploying stevedores and dockworkers to Allied ports worldwide in over a dozen PLA Dock Groups. Skilled The 1945 edition of PLA Monthly was slimmer - paper rationing was still in force after World War II - but its pages carried stories of resilience. During the war, the PLA had played a vital strategic role: coordinating convoys, maintaining navigation, and keeping the port functioning under relentless bombing. Entire dock complexes

had been destroyed, yet the river

kept moving.

Tanks in the London **Docks prepare for** embarkation for D-Day andings in 1944

> Features included reports on the "Phantom Fleet" that protected shipping lanes and the PLA's worldwide exhibition celebrating the port's wartime contribution. The organisation was now turning its energy to rebuilding, modernising and supporting dockworkers returning from military service.

Warehouses in St Katharine Docks ablaze during the Blitz September 1940

London dockers, were sent to strategic locations such as North Africa, the Middle East, and later to continental Europe following the D-Day landings and even Burma. Their expertise in loading and unloading military equipment, fuel, and supplies was vital to supporting Allied operations and maintaining the momentum of campaigns abroad.

Through its resilience, adaptability, and global coordination, the PLA proved indispensable to Britain's wartime logistics. Its leadership at home, its assistance in Glasgow, and the overseas service of its stevedores ensured that the flow of personnel and material continued helping to secure ultimate victory for the Allies but at the loss of over 125 employees and a badly damaged port infrastructure.

Chief Harbour Master

By 1955, the Port of London had been transformed from a bombdamaged landscape into one of the busiest docks in the world. Trade was booming again. Ships were getting bigger and the PLA was investing heavily in radar, short-wave radio, and new vesselhandling systems to keep pace with modern shipping.

The PLA Monthly of that year was thicker than during wartime, filled with adverts and optimism. Stories celebrated the return of international travel, the rebuilding of dockside facilities, and the revival of London as a global trading capital.

Back in Business

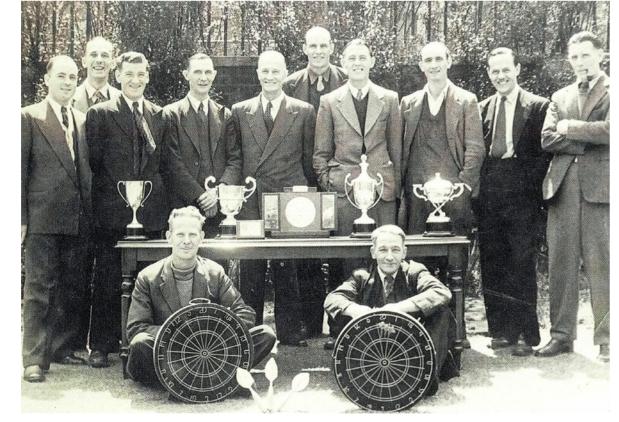

On people's minds:

Jobs and prosperity after years of rationing

Modernisation of the docks with radar and radio systems

The birth of post-war tourism and troop transport routes

There were many active sports teams in the PLA

PLA Staff Club Darts team in 1951

General view of the North Side, Royal Victoria Dock

THE MODERN PORT-VI.

The Royal Victoria Dock

IT seems to have been ordained that the Royal Victoria Dock should, so to speak, blush unseen. The official openings of most other docks in the Port of London were marked by some form of ceremony; but this dock was opened 100 years ago—on 26th November, 1855—merely by the entry of the Euterpe, the first commercial vessel to berth there. Moreover, the complete redesign of the dock was finished during the second world war when preparations for D Day permitted no such celebration.

o such celebration.

The dock was built by the Victoria Dock Comand Gallions Reaches to meet the increasing size of vessels then using the Thames. The addition of "Royal" to its name was made only on the opening of the adjoining Royal Albert Dock.

of the adjoining Royal Albert Dock.

The cost of construction was comparatively small, yet the design of the dock represented a complete departure from the accepted form. Instead of the long continuous quay which had until then characterised the docks of London, the north side was broken by a number of jetties at right angles to the main quay. Apart from this novel and not particularly successful feature, the dock was much the same as its predecessors, being equipped with the usual vaults, transit sheds and warehouses for the handling and storing of perishable and general cargo. As first built, the water area of the Royal Victoria Dock was 94 acres in extent.

Another distinguishing feature was a large area of pasture land on the south side, provided in anticipation of a traffic in live cattle from America which, in fact, never materialized. The Royal

which, in fact, never materialized. The Royal Victoria Dock was also the first in London to be

Victoria Dock was not intended to cater for an

offered by its then modern facilities and its low dues; in 1856 the net register tonnage of shipping using the dock was 410,463, and in 1860 it had risen to 850,337. The Company, in fact, contemplated making extensions to provide for their increasing trade, but before their plans could be effected they were absorbed, in 1864, by the London and St. Katharine Docks Company.

The Royal Albert Dock, which is to be dealt with later in this series was built in 1880 and ioned.

The Royal Albert Dock, which is to be dealt with later in this series, was built in 1880 and joined the eastern end of the older dock. Together the two docks provided a double line of berths for shipping some two miles long.

One of the first undertakings of the Port of London Authority when they were constituted in 1909 was to begin the construction of the King George V Dock, already described in this series, adjoining the Royal Albert Dock. When it was completed in 1921, the Royal Victoria Dock was something of a Cinderella in this group.

The layout of the dock was a severe handicap to its development, but the Port of London Authority began a long programme of modernisation. New

its development, but the Port of London Authority began a long programme of modernisation. New tobacco warehouses, the principal warehousing trade there, were built on the north side; and modern mechanical equipment for handling tobacco was provided for the older warehouses.

Two highly mechanised berths for the discharge and direct delivery of South American chilled beef, one of which was also equipped with a shed for the expeditious handling of green fruit and vegetables,

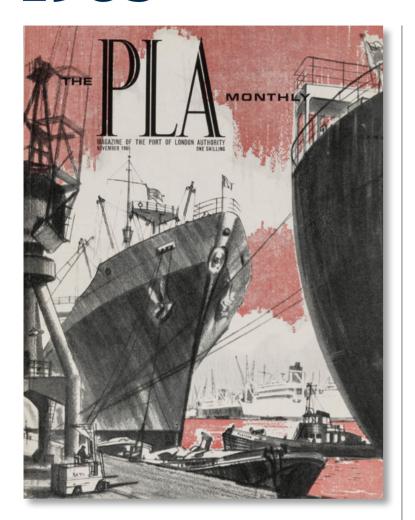

Advertising for dredging services

Modern echo:

Just as radar revolutionised the river in the 1950s, today's digital navigation and VTS technology continues that legacy of safety and innovation on the Thames.

The last vaultmen and coopers pose to record the last barrel out of London Docks in 1969

A New Look, A New Era

In 1965, PLA Monthly burst into colour for the first time. The front cover and advertising inserts reflected the optimism of the swinging sixties; London alive with trade, design, and daring new ideas.

This edition captured the handling of the world's largest teak log from Burma, and growing concern for the river's health. By the late 1950s the Thames had been declared "biologically dead", spurring new scientific efforts to clean and monitor it. The PLA's establishment of a network of weather stations along the river marked a step towards the environmental awareness we recognise today.

Modern echo:

From colour print to digital dashboards, the 1960s' spirit of innovation continues in today's push for sustainability and realtime river data.

The development of Hydrographic **Services from** the 1960s to the present

ne late 1960's saw the PLA significantly expand its jurisdiction into the Thames Estuary. For the Hydrographic Service responsible for mapping channel depths, this meant not only a 300% increase in area but one that's a significant distance from the shore making accurate positioning more challenging as well as more susceptible to adverse weather. Surveys were conducted using single beam echo sounders to measure depth and sextant angles from a network of wooden beacons for position.

The 1970's brought decimalisation which meant all charts being converted from feet to metres. This presented an opportunity to re-define the charts. Cartographers annotated the charts with soundings and drew contours by hand.

The 1980's saw the opening of the Thames Barrier and collaboration with what is now the Environment Agency on monitoring tidal levels, important for shipping as well as managing flood risk.

The 1990's saw the first use of global positioning systems and electronic charts first appearing on the bridges of ships. It was also the dawn of desktop computers and the internet meaning digital compilation of charts.

The 2000's saw the PLA invest in multibeam echosounders enabling full seafloor coverage to be achieved for the first time in line with evolving international survey standards. It was thought the new technology would speed up surveys, but in practice it primarily greatly improved accuracy and resolution (meaning we found a lot more wrecks and obstructions!).

The 2010's saw the use of laser scanners mounted aboard the survey vessel to map the exposed foreshore without having to send a vessel into shallow water. The building of London Gateway and the Tideway Tunnel required significant monitoring to ensure no adverse impact on the riverbed.

The 2020's has seen the use of unmanned aerial vehicles (drones) and autonomous surface vessels added to our capability. The decade will also see all chart products produced from a single electronic navigation chart source, with opportunities to further rationalise and improve speed of delivery of our chart products.

Alex Mortley

Conservancy Manager

On people's minds:

Colour printing and the rise of modern advertising

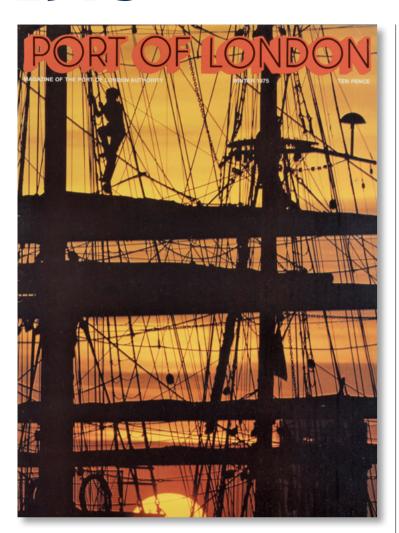

Growing concern over pollution and the river's future

Expanding hydrographic and weather-monitoring services

The Thames **Navigation Service TNS** was established in 1959, which was a major step forward in river safety

14 PORT OF LONDON NEWS: CENTENARY EDITION 2025

By 1975, the publication - now simply titled Port of London - reflected a port in transition. Containerisation was reshaping global trade, and new types of ships dominated the headlines: LNG tankers, grain carriers, and the largest vessels yet to enter the Thames.

Design had evolved too; with bold fonts, full-colour covers, and creative advertising celebrating the vitality of London's docks.

The PLA was diversifying its role: promoting the Clipper Regatta, showcasing leisure on the river, and balancing industrial growth with environmental responsibility.

Trade, Technology and Transformation

Modern echo:

The Port of London The Capital Port; London is the commercial heart of the UK; of North West Europe's richest and most heavily industrialised region.

The Commercial heart of Britain

The 1972 national dock strike and shifts in the workforce

Royal Visits (Queen, 1973, and Queen Mother, 1975)

CORY promoting river freight of waste

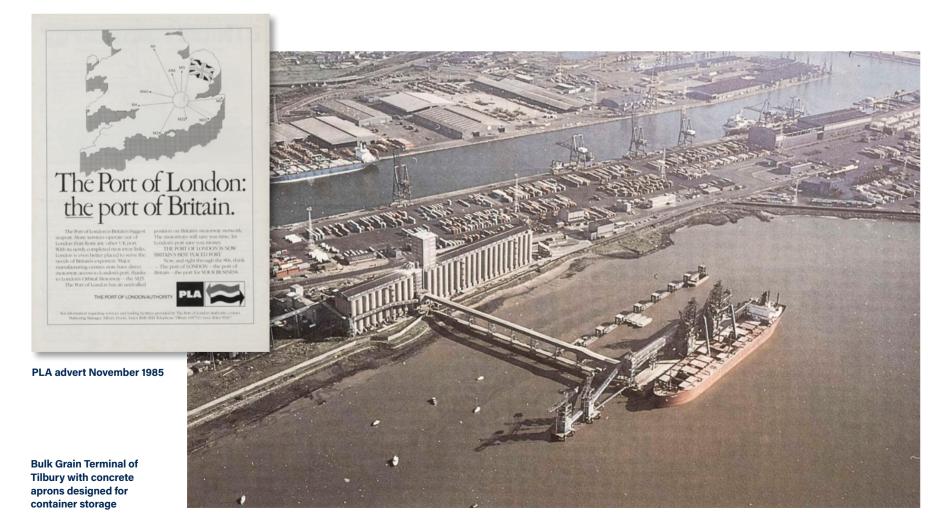

Credit: Dartford and Cambria Sea Scout Group, Active Thames Grant Recipients

By the mid-1980s, the Port of London had entered the computer age. The docks of old were giving way to container ports and automated systems, while safety and coordination on the river were being revolutionised by new technology.

The 1985 Port of London magazine highlighted a series of breakthroughs, from the introduction of the Port of London River Information System (POLARIS) to the first modern Vessel Traffic Services (VTS) network, ensuring safer, more efficient navigation across the Thames. Cargo was changing too: fewer crates and sacks, more containers and high-value goods that reflected a new global economy.

Technology Takes the Helm

Modern echo:

From paper charts to smart dashboards, the PLA's embrace of innovation in the 1980s laid the foundations for the data-driven river of today.

Credit: PLA Pilot Ivaylo Bratovanov

he 1980's were the most important years in modern history for Pilotage Operations, with the formation of the UKPA(M) in 1985 and the passing of the 1987 Pilotage Act.

In 1985, when facing the impending changes to Pilotage, two pilot organisations, UK Pilots Association and the Marine Pilots Branch of the TGWU, combined to become UKPA(M) and eventually the UKMPA that represent pilots today.

The 1987 Pilotage Act was passed to modernise the pilotage system in the UK, ensuring it responded effectively and enhanced navigational safety in British waters. The Act transferred responsibilities from central government to competent harbour authorities.

In the early eighties, UK ports were served by pilots, and pilot launches from the Trinity House Authority (THA). The PLA was served by the London District – which was the largest THA District – spanning from Dungeness to Felixstowe. Approximately 400 pilots worked in the London District.

There were four main pilot stations and five chief classes of pilots: River Thames Pilots, Channel Pilots, Cinque Ports Pilots, North Channel Pilots and River Medway Pilots. The various classes of pilot were controlled by Superintendents at Dover, Harwich, Gravesend and Chatham. The Superintendent at Gravesend had the title of 'Ruler of Pilots', dating back centuries to the time when pilots formed small groups to put up funds for a cutter (Trinity House, 2018).

On 1st October 1988 Pilotage for our district was transferred to the PLA, and as part of a 'transfer of Undertakings' a number of people and assets were transferred. THA pilots applied for positions and 140 pilots were employed by the PLA. No. 001 pilot was John Yarrow, who was a North Channel pilot. Mike Whitton, Mike Belsey and Paul Relf joined as the Pilotage Management team.

In March 1989, the PLA began direct recruitment and training of additional pilots. The first of these was No. 141, Roger Tappenden, who retired in September 2019 after a distinguished career.

Nowadays, the PLA Pilotage Management team has 8 team members and operates out of

the PLA headquarters in Gravesend. They support over 121 pilots to serve over 13,000 pilot acts each year.

PLA Pilots operate 24/7, 365 days a year. With their detailed knowledge of the river and its depths and tidal currents, Pilots therefore play a vital role in the day-to-day operations of the Port of London. They also have a huge input into planning for the demands of the future.

Boarding and landing of pilots now takes place from Sheerness, Ramsgate, Harwich and Gravesend. The pilot cutters at Sheerness and Ramsgate are purpose-

built craft operated by Estuary Services Ltd (ESL) which is a wholly-owned subsidiary of the PLA. Boarding and landing services at Harwich are provided by the Harwich Haven Authority and for operations at Gravesend the PLA uses its own pilot cutters. The majority of PLA pilots are Sea Pilots, however, specialist River Pilots work in the stretch of the Thames upriver of Gravesend.

Dave Newbury

From Industry to Environment

ooking out over the Thames in central London, you might assume it's a lifeless stretch of brown, murky water. However, the Thames was brown when the Romans arrived, its colour reflects the fact that it is a tidal river and in reality, decades of investment and collaboration have transformed the UK's most iconic river.

Once, the Thames was choked by sewage and waste from the capital. Despite Sir Joseph Bazalgette's pioneering Victorian sewer system, untreated effluent and industrial discharge left the river so polluted that, in 1957, it was declared "biologically dead."

That declaration marked a turning point. Waste treatment improved, water quality standards rose, and oxygenating "bubblers" were installed to support aquatic life. In the 1990s, the National Rivers Authority evolved into the Environment Agency, tasked with protecting rivers from flooding and pollution and enforcing the EU Water Framework Directive - introducing integrated river basin management to reverse decades of damage.

Throughout this period, the Port of London Authority (PLA) worked with the Environment Agency and other partners, such as Thames21, to tackle pollution. Gradually, fish returned: flounder, bass, eel and even salmon. Today, more than 115 species thrive in the Thames, including seahorses - clear evidence of improved water quality.

Yet the work is far from over. The PLA's Clean Thames Plan brings together public, private and third-sector organisations to address modern challenges. Ending industrial pollution in the 1950s was a milestone and today, the recent construction of the Thames Tideway Tunnel will divert millions of tonnes of sewage effluent away from the river. But new threats - such as microplastic, urban runoff and climate change demand bold, innovative solutions.

A clean Thames is a commitment to future generations. By working together, we can ensure this historic river remains a living, thriving ecosystem for decades to come.

Emily McLean

Senior Advisor - Technical & Project

THE ENVIRONMENT ACT: WHAT IMPLICATIONS FOR THE TIDY BRITAIN GROUP'S **WATER PROJECTS?**

Professor Graham Ashworth Director General Tidy Britain Group

Tidy Britain Group has been working with the National Rivers Authority on a number of litter abatement projects throughout Britain

over the past five years. In Manchester, the NRA has been the chief source of funding and support for the 'Water Watch' project, which is working to clean up the Mersey Basin's many waterways. In Wales, the River Taff has been subject of a four year programme, funded by the NRA, to reduce fly-tipping and sewage-derived litter. In London, the Tidy Britain Group and the NRA initiated 'Thamesclean', a partnership project to clean

By 1995, the river had changed beyond recognition. Tilbury had been sold to Forth Ports, containerisation was complete, and the focus had shifted from heavy industry to sustainability, recreation and renewal.

Editions celebrated the PLA's growing environmental leadership partnerships with the National Rivers Authority and the launch of Thamesclean, a campaign to improve water quality.

We also introduced POLATIDE, a pioneering computerised tidal monitoring system that placed the PLA among the industry's early digital innovators.

From Print to Pixels

On people's minds:

Regeneration of the **Thames Gateway and Docklands**

Environmental awareness and river wildlife stories capturing public imagination

In the 2000s, Port of London News took on a new look - newspaperstyle layouts, more photographs, and a livelier tone reflecting a fastchanging city. The PLA's focus was shifting once again: investment in London Gateway, support for river freight revival, and a renewed commitment to making the Thames central to London life.

Articles covered everything from the rescue of a stranded whale to the opening of Marine House, while new passenger services were reshaping daily travel along the river. The newsletter was evolving too, bridging the gap between print and digital ahead of the 2015 online launch.

Modern echo:

Today's Tidal Thames News continues that digital tradition

- reaching thousands of readers every month and sharing the story of a living, working river.

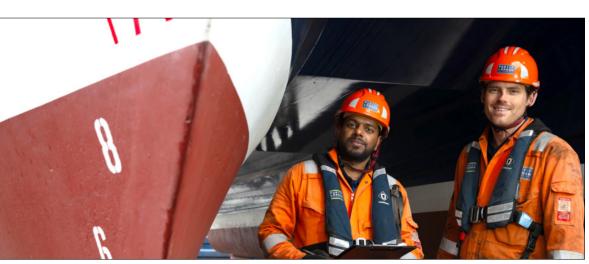

TIDAL THAMES

Marine House at Denton completed in 2006

Michael Russell PLA Diver, 2009

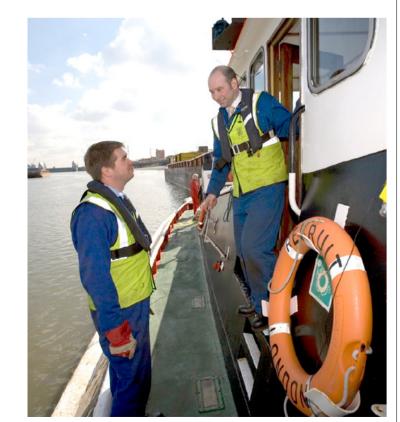

PLA Marine Surveyors Clayton Layton and Tom Parham

PLA Deputy Harbour Master Mark Towens and Marine Surveyor Tim Prior

By 2015, the PLA's long-running publication had fully entered the digital age. Tidal Thames News launched as an online newsletter - reflecting a new era of instant communication, video storytelling and global reach.

The river itself was busier than ever: passenger operators expanded their fleets, the Great River Race was drawing record crowds, and the Thames continued to appear on the world stage, even in a James Bond chase sequence. Behind the scenes, apprenticeships, new safety campaigns, and environmental partnerships were reshaping the PLA for a changing century.

On people's minds:

The revival of river transport for freight and passengers

London Gateway's expansion and major river investments

The digital transformation of PLA communications and data systems

Harbour Patrol Service PLA General Purpose Coxswain Steve Mordue in 2009

ver the past few decades, rapid advances in technology have transformed the way ships are managed and navigate at sea. One of the relatively newer areas of the maritime sector to benefit from this progress is Vessel Traffic Services (VTS) - the systems and teams that monitor and coordinate ship movements to keep the river Thames safe and efficient.

Originally, 'Port Control' relied heavily on radar, radio communication, flag and light signals to track vessels and relay information between ships and the shore. While effective for its time, these tools offered only limited coverage and depended largely on human observation and interpretation. Today, however, VTS has entered a new digital era.

Modern systems now combine solid state radar, Automatic Identification System (AIS) data, CCTV and real-time weather and tidal information to provide a comprehensive picture of maritime traffic. This not only improves safety but also reduces delays and fuel consumption, contributing to a more sustainable and efficient

The growth of cloud computing and highspeed data networks means that information can be shared instantly between ports, vessels, stakeholders and maritime authorities around the world. Remote monitoring and digital twins - virtual replicas of ports or systems within ports | Harbour Master (SMS & VTS)

- are beginning to play a role in simulating traffic scenarios and planning for future increases in traffic volume and port expansion.

Looking ahead, technological growth shows no sign of slowing. Developments in automation, machine learning, and satellite communication promise even greater levels of accuracy, coordination, and environmental protection, Artificial intelligence (AI) and data analytics is being developed to detect potential collisions or bottlenecks before they happen, which will allow VTS Operators to 'look into the future' and take early proactive measures to deconflict traffic. Developments in remote and autonomous vessels will further impact VTS and how the service is delivered, particularly to vessels with no crew on board! As the maritime industry continues to embrace innovation. Vessel Traffic Services will remain at the heart of global trade - smarter, safer, and more connected than ever

To ensure the Port of London is ready for these developments we are investing in the Marine Centre Transformation Project (MCTP), a new modern operations centre capable of delivering our important Vessel Planning and VTS services now and into the future.

Simon Phillips

Modern echo: A decade later, Tidal Thames News continues that mission, linking every part of the river network through stories that celebrate innovation, safety and

stewardship.

As we look back across a century of headlines, it's clear that the Thames has never stood still. Every generation has faced its own challenges - from war to renewal, pollution to climate change - yet the river endures, adapting and inspiring in equal measure.

In the coming years, the river will face new challenges (rising sea levels, shifting trade routes, and an ever-evolving growing capital city). But the PLA and its partners are investing in the future, just as those before us did.

The Port of London Authority's story is, above all, a story of people: those who keep the river working, safe, and alive.

Here's to the next hundred years of news on the tidal Thames.

I'm Director of Corporate Affairs at the Port of London Authority, and it's my team who are responsible for collating, writing and publishing the **Tidal Thames News each** fortnight. It's a privilege to continue the tradition of a regular newsletter, even if its format has changed a little over the 100 years.

s I write this, I'm thinking of the generations of Port of London people – our employees and those of all the businesses based along 95 huge totals of the shipping tonnage using London was another source of amazement to visitors who had not miles of the tidal Thames, our communities and elected representatives - whose stories have been captured | realised that [in 1924] over forty-five million net register over the past century. The changing landscape, shifting tons of shipping entered and left the Port of London." In economic hubs and evolving priorities. It has been fascinating to learn a little bit more about their lives at | the Port and yet people are still surprised to learn that the port and I've loved reading the perspectives of their counterparts today.

I'm also thinking of my predecessors and the people who chose what to capture, who wrote and edited the stories, who took the photos and designed the layouts. Who took the decision to publish the very first PLA Monthly in 1925 (was it a difficult sell to their bosses | Siân Foster or was it welcomed as a great new innovation?!) and Director of Corporate Affairs then keep it going through a world war and significant periods of change for the port.

I particularly loved reading that at an exhibition in 2024, around 52 million tonnes of cargo passed through we're the UK's biggest port!

Thank you to everyone who has contributed to our newsletter over the years. But, in particular, a huge thank you to everyone involved in putting together this special edition and to the team at London Museum Docklands for taking such great care of our archives.

Thames Tidal News 100 Editorial Team

Siân Foster **Director of Corporate Affairs**

Charlotte Collins Website and Social Media Manager

Mark Anderson **Head of Corporate Affairs**

Shannon White Website and Social Media Officer

Tash Grav Media and Content Manager

Lead - Projects and Events

Abbie Boyd Internal Communications Officer

We would like to say a big thank you to London Museum Docklands and archivist Fiona Keates for their assistance in putting this special centenary edition of Tidal Thames News together.
